

Egypt Real Estate 2026 Dashboard Insights Report

ADVANCED DATA ANALYTICS

Executive Summary

This report synthesizes key insights from interactive dashboards built using Power BI and Tableau, drawing upon scraped listing data from and . The analysis covers the Egyptian real estate market as of August 2026, providing a comprehensive overview of market dynamics, pricing trends, location intelligence, property specifications, and temporal patterns.

PART 1 — POWER BI DASHBOARD INSIGHTS

The Power BI workbook delivers six interactive report pages built on a star-schema data model. Together they answer five strategic questions: What does the overall market look like? Where are prices highest? Which property features command premiums? Who are the top-performing agents? And how has the market moved over time?

1.1 Market Overview

The Market Overview page provides a top-level snapshot of the entire dataset through five KPI cards, a buy-vs-rent donut, listings-by-property-type and listings-by-city bar charts, and a price-band stacked bar per city.

Key Insights — Market Overview

- Apartment listings dominate the Egyptian real estate market, followed by chalets and villas — understanding this composition is critical for segmented pricing analysis.
- Cairo and New Cairo consistently hold the largest share of total listings, indicating the most liquid sub-markets.
- The price-band stacked bar reveals that affordable (Under 5M EGP) inventory is geographically concentrated in second-tier cities, while premium (Above 15M EGP) supply clusters in New Cairo and Sheikh Zayed.
- Rental listings are a meaningful share of total inventory; cities with high rent-to-buy ratios are potential hotspots for buy-to-let investors.
- Use the city and property-type slicers together to isolate niche segments — e.g., furnished apartments for rent in Maadi — that the top-level KPIs would otherwise mask.

1.2 Location Intelligence

This page combines a bubble map (district-level price per SQM), a drill-down matrix (City → Town → District), and two ranked bar charts for the top 15 towns by price and volume.

Key Insights — Location Intelligence

- Upscale compounds in New Cairo and Sheikh Zayed command the highest price per SQM nationally; coastal districts in Ain Sokhna and North Coast spike seasonally for vacation properties.
- The City → Town → District drill-down matrix reveals sharp intra-city price variance — two towns in the same city can differ by 2× in median SQM price, making town-level targeting essential.
- Top 15 Towns by Volume often differ from Top 15 by Price, which means high-supply areas are not always high-price — useful for identifying undervalued inventory.
- Coastal and resort-market towns rank highly by price per SQM but with thinner listing counts, signalling niche/premium segments rather than mainstream activity.
- Districts with few listings but high prices warrant caution — small sample size inflates apparent medians; cross-reference with the matrix's listing count column.

1.3 Property Specs & Pricing

This page analyses how physical attributes — bedrooms, bathrooms, furnished status, total area — and amenity count drive price per SQM, using column charts, a log-scale scatter, and the 20-amenity ranked bar.

Key Insights — Specs & Pricing

- Smaller units (1–2 bedrooms) frequently achieve a higher price per SQM than larger ones in the same city — driven by rental demand and investor preference for smaller, easier-to-let properties.
- Furnished listings command a significant price premium over unfurnished equivalents; semi-furnished units sit in between — the Furnished Status bar chart quantifies this spread precisely.
- The Area vs Price log-scale scatter confirms a positive correlation, but type-level dispersion is wide — property type (villa vs apartment) is a stronger price determinant than raw area.
- Amenity count has a clear positive relationship with price per SQM up to around 10–12 amenities; beyond that, diminishing returns appear — the line chart on amenity count vs price illustrates this inflection.
- The Amenity Price Summary bar chart reveals that luxury/experiential amenities (private pool, shared spa, water view) rank at the top, while functional amenities (security, covered parking) rank lower but appear in more listings.

1.4 Agent & Listing Quality

The Agent & Quality page tracks listing quality flags (premium, verified, featured, new construction, direct-from-dev, furnished) and broker performance through ranked bar charts, a scatter, and a sortable agent table.

Key Insights — Agent & Listing Quality

- Premium listings represent a small but meaningful share of total inventory — filtering to premium-only dramatically narrows the dataset and raises average asking prices, confirming the premium tier is real and distinct.
- Verified listings cluster disproportionately with top-ranking agents — verification is both a trust signal and a performance differentiator.
- The Agent Volume vs Avg Price scatter reveals two distinct agent archetypes: volume specialists (many listings, mid-market price) and premium specialists (fewer listings, high price).
- Super-agents (top 10 by volume) account for a disproportionate share of featured and verified listings — network and platform access compound their advantage.
- New-construction and direct-from-developer listings carry a separate price premium independent of furnishing status — these are distinct market segments worth filtering for.

1.5 Temporal Trends & Seasonality

This page tracks listing volume and average price per SQM over time using a dual-axis line chart, a month-level bar chart of listing counts, and a season-tagged trend overlay.

Key Insights — Temporal Trends & Seasonality

- Listing volume peaks in January (post-holiday market restart) and September (academic-year relocation cycle) — the two most active months for new supply entering the platform.
- Buy price per SQM shows a consistent upward trend across the 2024–2026 window, while rent price per SQM has grown more slowly — this compression is gradually narrowing gross rental yields.
- Q2 (April–June) represents the spring buying season: highest listing activity, strongest price momentum, and fastest time-to-inquiry metrics.
- Mid-week publishing (Thursday) correlates with higher listing engagement — agents appear to time launches ahead of the weekend browsing cycle.
- Seasonal overlays confirm that coastal/vacation markets (North Coast, Ain Sokhna) show inverted seasonality versus urban residential markets — peak activity in summer months rather than spring.

1.6 Time Intelligence Deep Dive

This page extends the temporal analysis using DAX time-intelligence functions: Month-over-Month (MoM) price change, Quarter-over-Quarter (QoQ) volume change, Year-to-Date (YTD) cumulative listing counts, and a rolling 3-month average price.

Key Insights — Time Intelligence

- MoM price changes reveal short-term volatility masked by quarterly averages — individual months can swing $\pm 5\text{--}8\%$ even in an overall uptrend.
- QoQ volume analysis confirms Q1 2026 saw a deceleration in new listing supply growth relative to Q1 2025 — an early signal of market cooling.
- YTD cumulative listing counts confirm Cairo and Giza as the most consistently active markets; New Cairo shows the steepest YTD price appreciation curve.
- The rolling 3-month average smooths noise and confirms the broader upward price trend is intact as of August 2026, though the rate of appreciation is slowing.
- Comparing YTD listing counts to prior-year same-period reveals that 2026 supply is running ahead of 2025 in most cities — increasing absorption pressure on pricing.

PART 2 — TABLEAU DASHBOARD INSIGHTS

2.1 Amenity Intelligence

Dashboard 1 delivers a full amenity deep-dive: a ranked bar chart of average price per SQM by amenity, an amenity count vs price scatter, a co-occurrence heatmap, and a furnishing-status breakdown.

Key Insights — Amenity Intelligence

- Private pools, water views, and private gardens sit at the top of the amenity premium ranking — listings with these features command average price-per-SQM values substantially above the market baseline.
- Standard functional amenities (security, balcony, covered parking) appear in a high proportion of listings but contribute comparatively lower price premiums per SQM — they are expected features, not differentiators.
- The amenity count vs price scatter confirms a positive but non-linear relationship: the steepest price-per-SQM gains occur in the 0–6 amenity range; above ~10 amenities, marginal price impact flattens.
- Furnished listings with high amenity counts cluster in the upper-right quadrant of the scatter — these represent the most premium, investment-grade rental products on the platform.
- The co-occurrence heatmap shows that Shared Pool co-occurs most frequently with Shared Gym and Security — confirming that resort-style amenity bundles dominate new-construction compounds.
- Selecting "Private Pool" as the base amenity reveals very high co-occurrence with Walk-in Closet, Maids Room, and Private Garden — these amenities cluster together in ultra-luxury villa listings.
- Semi-furnished listings form a distinct middle cluster in the scatter — priced above unfurnished but below fully furnished, with moderate amenity counts.

2.2 Geospatial & Yield Explorer

Dashboard 2 combines a coordinate-level point map of all listings, a subdistrict/compound price ranking, a bubble map of rental yield by town, and a dual-axis buy-vs-rent comparison by district.

Key Insights — Geospatial & Yield Explorer

- The point map immediately reveals geographic clustering of high-value properties — New Cairo and Zayed show dense red-orange clusters indicating premium price zones, while peripheral areas display green clusters (affordable bands).
- Compound-level (subdistrict) ranking shows sharper price differentiation than city or district averages — two compounds 1 km apart can differ by 40–60% in median price per SQM, reflecting brand, amenity, and location-within-compound effects.
- The market reference line on the compound ranking chart allows instant identification of which compounds are above vs below market — crucial for relative pricing intelligence.
- Towns with the highest rental yield (typically 7–10%+) are not necessarily the most expensive — mid-tier towns with balanced buy and rent markets sometimes outperform premium areas on yield.
- The dual-axis Buy vs Rent chart by district confirms that rental price per SQM tracks buy price per SQM directionally but with compression — premium buy districts do not command proportionally higher rent, resulting in lower yields at the top end.
- Selecting a city on the point map filters all right-side panels simultaneously — this allows a rapid deep-dive into any city without losing geographic context from the map.
- Coastal and North Coast districts show inverted seasonality — vacation/chalet listings cluster at high-price coordinates but represent thin annual supply compared to year-round residential markets.

2.3 Temporal Patterns & Price Momentum

Dashboard 3 provides Tableau-specific temporal depth: a Month × Day activity heatmap, a quarterly dual-axis price trend, multi-city price trajectories over time, a listing age distribution by quarter, an animated listing velocity scatter, and a season × month-period grouped bar.

Key Insights — Temporal Patterns & Price Momentum

- The Month × Day heatmap reveals that Thursday and Sunday generate peak listing activity in the Egyptian market — agents appear to schedule listings ahead of the weekend browsing cycle.
- January and September are the two highest-activity months in the heatmap — January driven by post-holiday market restarts, September by the academic-year relocation cycle.
- The quarterly dual-axis price trend shows Buy price per SQM trending upward across 2024–2026, while Rent price per SQM shows flatter growth — this compression is gradually narrowing rental yields.
- City price trajectory lines diverge significantly after Q2 2025 — premium cities (New Cairo, Sheikh Zayed) accelerate upward while more affordable cities show moderate growth, indicating a bifurcating market.
- The listing age distribution stacked bar chart shows a rising proportion of 90-day+ listings over time — a signal that absorption is slowing relative to new supply entering the market.
- Animated velocity scatter: Cairo and Giza bubbles trend toward shorter days-on-market over time

despite rising prices — confirming they are the most liquid markets. Coastal cities move rightward (longer days on market) during off-peak quarters.

- Season × Month Period analysis confirms that listings published in the "Beginning" of Spring months (early March and April) are most likely to fall in the highest-activity periods — the optimal window for new listing launches.
- Price momentum (quarterly trend) is positive for buy listings in premium cities but the rate of appreciation is decelerating in 2026 relative to 2025, suggesting the market may be approaching an inflection point.

Market Analysis, Business Insights & Strategic Recommendations

1.1 Market Overview

- **1. Apartment Listings**
 - **Insight:** Apartment listings dominate the Egyptian real estate market, followed by chalets and villas.
 - **Business Impact:** The apartment segment represents the largest market opportunity, making it the primary revenue driver for developers, brokers, and investors.
 - **Recommendation:** Continue prioritizing apartment developments while introducing differentiated products targeting both affordable and premium customer segments.
- **2. Market Concentration**
 - **Insight:** Cairo and New Cairo account for the largest share of listings, making them the most active and liquid real estate markets in Egypt.
 - **Business Impact:** High listing activity indicates stronger buyer demand, faster property turnover, and greater investment opportunities.
 - **Recommendation:** Allocate more marketing budgets, sales resources, and new developments to Cairo and New Cairo while monitoring emerging cities.
- **3. Price Distribution**
 - **Insight:** Affordable properties (under 5M EGP) are mainly concentrated in second-tier cities, while premium properties are heavily concentrated in New Cairo and Sheikh Zayed.
 - **Business Impact:** The market consists of different customer segments, each requiring different pricing, marketing, and investment strategies.
 - **Recommendation:** Develop separate marketing campaigns for affordable and premium markets.
- **4. Rental Market**
 - **Insight:** Rental listings represent a significant portion of the market, and cities with high rent-to-buy ratios provide attractive opportunities for rental investments.
 - **Business Impact:** Strong rental demand creates stable cash-flow opportunities and increases the attractiveness of buy-to-let investments.
 - **Recommendation:** Investors seeking recurring income should prioritize cities with strong rental demand and favorable rent-to-buy ratios.
- **5. Market Segmentation**
 - **Insight:** Combining city and property-type filters reveals specialized market segments not

visible in the overall market view.

- **Business Impact:** Market segmentation enables businesses to better understand customer needs and design more targeted marketing strategies.
- **Recommendation:** Use location and property-type segmentation when launching marketing campaigns or evaluating investment opportunities.

1.2 Location Intelligence

● 1. Premium Locations

- **Insight:** New Cairo and Sheikh Zayed record the highest average price per square meter, while coastal destinations such as Ain Sokhna and the North Coast experience seasonal price increases.
- **Business Impact:** Premium locations generate higher revenues and profit margins but require different investment strategies.
- **Recommendation:** Focus premium developments in high-value districts while leveraging seasonal demand in coastal markets.

● 2. Intra-City Price Variation

- **Insight:** Property prices vary significantly within the same city, with some towns recording nearly double the price per square meter of neighboring areas.
- **Business Impact:** City-level analysis alone may lead to inaccurate pricing and investment decisions.
- **Recommendation:** Base investment and pricing decisions on town or district-level analysis rather than relying only on city averages.

● 3. Volume vs Price

- **Insight:** Areas with the highest listing volumes are not necessarily the most expensive, indicating that supply and pricing are influenced by different market dynamics.
- **Business Impact:** High supply does not always indicate premium value, creating opportunities to identify undervalued investment locations.
- **Recommendation:** Evaluate both listing volume and price together before selecting target investment areas.

● 4. Premium Coastal Markets

- **Insight:** Resort towns rank among the highest in price per square meter despite having relatively few listings, reflecting niche luxury markets.
- **Business Impact:** Luxury resort markets generate premium pricing but typically serve a smaller customer base.
- **Recommendation:** Position coastal developments as premium lifestyle investments instead of competing on sales volume.

● 5. Data Reliability

- **Insight:** Districts with very few listings may show unusually high prices because small sample sizes can distort market averages.
- **Business Impact:** Investment decisions based on limited market data may increase pricing risk.
- **Recommendation:** Validate pricing using listing volume and additional market indicators before making investment or valuation decisions.

1.3 Property Specs & Pricing

- **1. Smaller Units**
 - **Insight:** Smaller properties (1-2 bedrooms) generally achieve a higher price per square meter than larger units.
 - **Business Impact:** Smaller residential units generate higher value per square meter and provide developers with better pricing efficiency.
 - **Recommendation:** Increase the proportion of one- and two-bedroom units in new residential developments.
- **2. Furnished Status**
 - **Insight:** Furnished properties command a noticeable price premium over unfurnished properties, while semi-furnished units occupy the middle segment.
 - **Business Impact:** Buyers are willing to pay more for move-in-ready properties.
 - **Recommendation:** Offer furnished packages or optional furnishing upgrades to increase property value.
- **3. Property Size**
 - **Insight:** Although larger properties generally have higher total prices, property type has a greater influence on price per square meter than area alone.
 - **Business Impact:** Pricing strategies based only on property size may overlook more influential market factors.
 - **Recommendation:** Build pricing models that consider property type, location, and amenities alongside total area.
- **4. Amenity Count**
 - **Insight:** The number of amenities positively affects property value up to approximately 10-12 amenities, after which additional amenities provide diminishing returns.
 - **Business Impact:** Excessive investment in additional amenities may increase development costs without generating proportional increases in selling prices.
 - **Recommendation:** Focus investment on the amenities that customers value most instead of maximizing the total number of available facilities.
- **5. Luxury Amenities**
 - **Insight:** Luxury amenities such as private pools, shared spas, and water views contribute the highest price premiums.
 - **Business Impact:** Premium amenities create competitive differentiation and justify higher selling prices in luxury developments.
 - **Recommendation:** Prioritize high-value lifestyle amenities in premium projects while maintaining essential amenities across all developments.

1.4 Agent & Listing Quality

- **1. Premium Listings**
 - **Insight:** Premium listings represent a relatively small portion of the market but achieve noticeably higher average asking prices.
 - **Business Impact:** Premium properties contribute disproportionately to revenue despite

representing a smaller share of total listings.

- **Recommendation:** Increase premium listing opportunities for high-quality properties to improve overall profitability.

- **2. Verified Listings**

- **Insight:** Verified listings are concentrated among top-performing agents, indicating that verification strengthens credibility and customer confidence.
- **Business Impact:** Trust signals improve customer engagement and increase the likelihood of successful transactions.
- **Recommendation:** Encourage agents to verify listings and maintain complete property information.

- **3. Agent Performance**

- **Insight:** The market consists of two distinct agent groups: high-volume agents serving the mainstream market and premium specialists focusing on high-value properties.
- **Business Impact:** Sales performance depends on matching the right agent with the appropriate market segment.
- **Recommendation:** Assign agents according to their specialization and experience within each market segment.

- **4. Super Agents**

- **Insight:** Super-agents manage a large proportion of featured and verified listings, giving them greater market visibility and competitive advantage.
- **Business Impact:** Strong agent networks significantly influence listing exposure and customer acquisition.
- **Recommendation:** Develop incentive programs that encourage agents to improve listing quality and expand their professional networks.

- **5. New Construction**

- **Insight:** New-construction and direct-from-developer properties achieve additional price premiums regardless of furnishing status.
- **Business Impact:** Buyers recognize newly developed properties as higher-value investments.
- **Recommendation:** Highlight new-construction status in marketing campaigns and continue expanding direct-from-developer offerings.

1.5 Temporal Trends & Seasonality

- **1. Seasonal Demand**

- **Insight:** Listing activity reaches its highest levels during January and September.
- **Business Impact:** Seasonal demand significantly influences customer activity and sales performance.
 - **Recommendation:** Schedule new project launches and marketing campaigns during these high-demand periods.

- **2. Price Trends**

- **Insight:** Buy prices have steadily increased between 2024 and 2026, while rental prices have grown at a slower pace, gradually reducing rental yields.
- **Business Impact:** Capital appreciation continues to outperform rental growth, changing investment priorities for buyers.
- **Recommendation:** Balance investment portfolios between capital appreciation opportunities

and income-generating rental properties.

- **3. Spring Market**

- **Insight:** Q2 (April-June) represents the strongest buying season, with the highest listing activity and price momentum.
- **Business Impact:** Strong market momentum increases the likelihood of faster sales and better selling prices.
- **Recommendation:** Plan major property launches during the spring season to maximize exposure and sales performance.

- **4. Publishing Strategy**

- **Insight:** Listings published on Thursdays receive higher engagement as buyers begin searching before the weekend.
- **Business Impact:** Publishing timing directly affects listing visibility and customer engagement.
- **Recommendation:** Schedule new property listings on Thursdays whenever possible.

- **5. Coastal Seasonality**

- **Insight:** Coastal destinations experience different seasonal patterns from urban markets, with demand peaking during the summer vacation season.
- **Business Impact:** Seasonal markets require different sales and marketing strategies.
- **Recommendation:** Align promotional campaigns for coastal projects with holiday seasons and peak tourism periods.

1.6 Time Intelligence Deep Dive

- **1. Monthly Volatility**

- **Insight:** Monthly price movements fluctuate by approximately 5-8%, even though the overall market continues its long-term upward trend.
- **Business Impact:** Short-term fluctuations may influence buyer decisions and create temporary pricing opportunities.
- **Recommendation:** Monitor monthly market changes instead of relying only on annual trends.

- **2. Market Cooling**

- **Insight:** Quarter-over-quarter analysis shows that listing supply growth slowed during Q1 2026, indicating an early sign of market cooling.
- **Business Impact:** Slower market growth increases competition among sellers.
- **Recommendation:** Adopt flexible pricing strategies and closely monitor demand indicators before launching new projects.

- **3. YTD Performance**

- **Insight:** Cairo and Giza remain the most active markets, while New Cairo records the strongest year-to-date price appreciation.
- **Business Impact:** High-growth cities continue attracting both developers and long-term investors.
- **Recommendation:** Prioritize future investments in cities demonstrating strong and consistent price growth.

- **4. Long-Term Trend**

- **Insight:** The rolling three-month average confirms that prices continue to rise, although the pace of growth has started to slow.
- **Business Impact:** The market remains healthy but may be transitioning toward a more

balanced growth phase.

- **Recommendation:** Monitor future pricing trends carefully and avoid overly aggressive pricing strategies.

- **5. Supply Growth**

- **Insight:** Listing supply in 2026 exceeds the previous year across most cities, increasing competition among available properties.
- **Business Impact:** Higher inventory levels may increase selling periods and reduce pricing power.
- **Recommendation:** Differentiate listings through competitive pricing, premium presentation, and value-added services.

2.1 Amenity Intelligence

- **1. Premium Amenities**

- **Insight:** Properties featuring premium amenities such as private pools, water views, and private gardens achieve the highest average price per square meter.
- **Business Impact:** Luxury amenities significantly increase property value and help developers differentiate premium projects.
- **Recommendation:** Prioritize premium lifestyle amenities in high-end developments to justify higher selling prices.

- **2. Standard Amenities**

- **Insight:** Functional amenities such as security, balconies, and covered parking appear in most listings but contribute relatively small price premiums.
- **Business Impact:** Standard amenities improve market competitiveness but provide limited pricing advantages.
- **Recommendation:** Maintain essential amenities across all developments while investing in unique features.

- **3. Amenity Count**

- **Insight:** Property prices increase as the number of amenities grows; however, the impact begins to level off after approximately ten amenities.
- **Business Impact:** Adding excessive amenities may increase construction costs without generating equivalent increases in selling prices.
- **Recommendation:** Focus investment on high-impact amenities instead of maximizing the total number of available facilities.

- **4. Furnished Premium Properties**

- **Insight:** Furnished properties with a high number of amenities are concentrated within the premium segment and command some of the highest prices.
- **Business Impact:** Combining furnishing with premium amenities creates highly competitive investment products.
- **Recommendation:** Develop fully furnished premium units targeting investors seeking ready-to-rent properties.

- **5. Amenity Bundles**

- **Insight:** Shared Pool, Shared Gym, and Security frequently appear together, while luxury villa amenities form a separate premium bundle.
- **Business Impact:** Customers value complete lifestyle packages more than individual

amenities.

- **Recommendation:** Design developments around complementary amenity packages that match each target market.

2.2 Geospatial & Yield Explorer

● 1. Geographic Clustering

- **Insight:** Premium properties are heavily concentrated in New Cairo and Sheikh Zayed, while lower-priced properties are mainly located in peripheral cities.
- **Business Impact:** Property values are strongly influenced by geographic location, creating clear premium and affordable market zones.
- **Recommendation:** Align investment strategies with regional demand by expanding premium developments in high-value areas.

● 2. Compound-Level Pricing

- **Insight:** Property prices vary considerably between neighboring compounds, reflecting differences in branding, amenities, and development quality.
- **Business Impact:** Compound reputation has a direct influence on pricing power and customer perception.
- **Recommendation:** Evaluate investments at the compound level rather than relying only on district or city averages.

● 3. Rental Yield

- **Insight:** The highest rental yields are achieved in balanced mid-tier towns rather than premium locations.
- **Business Impact:** High property prices do not always produce the highest investment returns.
- **Recommendation:** Income-focused investors should prioritize high-yield mid-tier towns, while premium districts remain suitable for long-term capital appreciation.

● 4. Buy vs Rent

- **Insight:** Rental prices generally follow the same trend as purchase prices, but rental growth is slower, reducing yields in luxury locations.
- **Business Impact:** Premium properties generate strong capital value but may produce lower rental returns than expected.
- **Recommendation:** Balance investment portfolios between high-appreciation assets and high-yield rental markets.

● 5. Interactive Geographic Analysis

- **Insight:** Filtering data by city enables detailed analysis of pricing, rental yields, and property characteristics.
- **Business Impact:** Regional analysis improves decision-making by identifying localized opportunities and market differences.
- **Recommendation:** Perform city-level and district-level analysis before making pricing or investment decisions.

2.3 Temporal Patterns & Price Momentum

- **1. Weekly Activity**
 - **Insight:** Thursday and Sunday record the highest listing activity, indicating that agents strategically publish listings before peak customer browsing periods.
 - **Business Impact:** Publishing schedules directly influence listing visibility and customer engagement.
 - **Recommendation:** Schedule new listings during high-traffic days to maximize online exposure.
- **2. Seasonal Demand**
 - **Insight:** January and September consistently experience the highest market activity due to post-holiday demand and academic-year relocation.
 - **Business Impact:** Seasonal demand creates predictable opportunities for higher sales performance.
 - **Recommendation:** Launch new developments and promotional campaigns before seasonal demand peaks.
- **3. Price Momentum**
 - **Insight:** Buy prices continue to rise across premium cities, while rental prices increase more gradually, reducing rental yields over time.
 - **Business Impact:** Investors increasingly benefit from capital appreciation rather than rental income alone.
 - **Recommendation:** Combine long-term appreciation strategies with carefully selected high-yield rental investments.
- **4. Market Liquidity**
 - **Insight:** Cairo and Giza continue to record shorter selling periods despite increasing prices, confirming their position as the most liquid real estate markets.
 - **Business Impact:** High market liquidity reduces investment risk and improves cash flow.
 - **Recommendation:** Prioritize high-demand cities for short-term investment opportunities and faster property turnover.
- **5. Market Outlook**
 - **Insight:** Listing inventories continue to grow while price appreciation gradually slows, suggesting the market is moving toward a more balanced growth phase.
 - **Business Impact:** Increasing supply may intensify competition, making pricing accuracy and product differentiation more important.
 - **Recommendation:** Adopt data-driven pricing strategies, monitor inventory performance regularly, and differentiate properties through quality, amenities, and targeted marketing.

Summary & Strategic Recommendations

Metric	Insight
Market Structure	Apartment-dominant, Cairo-centric, with a bifurcating premium tier growing faster than the mainstream market.
Price Drivers	Location (compound > district > city), amenity

	bundle quality, and furnished status are the primary price-per-SQM determinants.
Yield Opportunities	Mid-tier towns with balanced buy/rent supply offer the best annual rental yields (7–10%); ultra-premium areas are 3–5% yield zones.
Agent Landscape	Super-agents specialize in premium listings; volume leaders are not price leaders — strategy and segment must be matched.
Timing	Spring (March–May) and post-summer (September) are peak activity windows; mid-week Thursday publishing maximizes listing visibility.
Risk Signals	Rising stale listing % and slowing price momentum in 2026 suggest absorption is lagging new supply — pricing accuracy is critical.
